A Practical Guide to GIS in AutoCAD Civil 3D (Part 1)

Rick Ellis
CADapult Software Solutions

Learning Objectives

- Learn how to create a surface in AutoCAD Civil 3D from GIS contours
- Learn how to create a pipe network from GIS Data
- Learn how to view and edit GIS data in AutoCAD Civil 3D
- Learn how to quickly label objects with annotation templates

Description

If you are an AutoCAD Civil 3D user being asked to provide data to your geographic information system (GIS) department, if you are being asked to use GIS data as background data for your designs, or if you think GIS is a 4-letter word—this class will answer this all-too-common question: “Why should I care about GIS?” You will learn to import GIS data not only as AutoCAD objects, but also directly as AutoCAD Civil 3D objects like Surfaces and Pipe Networks that use the existing database information. Once that data is in AutoCAD Civil 3D software, we’ll explore ways to use it with labeling tools and other display techniques. This popular class has won the award for Best Hands-on Lab at Autodesk University; don’t miss your chance to learn how the GIS tools in AutoCAD Civil 3D can make you more productive by automating common everyday tasks.

Speaker(s)

Rick Ellis is the President of CADapult Software Solutions, Inc., where he provides training and consulting services to clients around the country, helping them get the most out of their design software investment. Rick specializes in AutoCAD® Civil 3D®, AutoCAD® Map 3D, Autodesk® InfraWorks™, AutoCAD® Raster Design, and AutoCAD®. He is a member of the Autodesk Developer Network, and author of several critically acclaimed books on AutoCAD Civil 3D, and AutoCAD Map 3D; including the Practical Guide series. Rick continues to use AutoCAD Civil 3D on projects in a production environment, in addition to teaching classes to organizations both large and small around the country. This practical background and approach has made him a sought-after instructor by organizations around the world.

rick@cadapult-software.com
@theRickEllis
Introduction to GIS in Civil 3D

In addition to all of the tools built into Civil 3D for the civil engineering workflow, the software also includes many powerful tools for creating, editing, importing, displaying and utilizing a wide range of GIS and mapping data. For instance, aerial and satellite imagery can be displayed, geometric data that includes corresponding tabular data can be attached to existing AutoCAD objects, such as lines representing pipes and polygons representing tax lots. Geometry with corresponding tabular data can also be attached to, or displayed in Civil 3D drawing files, from a variety of GIS sources, such as ESRI Shapefiles and Autodesk SDF.

Many of these additional tools can be used alone, or in various combinations, and are not necessarily limited to GIS and mapping projects, or even civil design projects. Unlike most Civil 3D workflow processes, these tasks are typically not linear. For instance, for any given project you may use different combinations of these tools or processes, in different sequences.

AutoCAD Civil 3D is built on top of AutoCAD Map 3D, which is built on top of standard AutoCAD. Using the many tools found in Civil 3D, you can work with three types of objects: standard AutoCAD objects, (such as lines, arcs, circles, polylines and blocks); Map 3D objects, (such as Object Data, Topologies and connected Features); and Civil 3D objects, (such as alignments, profiles, parcels, surfaces, and pipe networks); and. These objects that are unique to the Map 3D tools in Civil 3D will be explained in the Lessons and exercises to follow.

I would encourage you to think of this as a toolbox that contains many related, yet separate tools. Each tool has its own function and purpose. As you learn and become proficient with these tools you become a skilled craftsman knowing what tool is best suited for each task you encounter during your project. I would encourage you not to limit yourself to simply the examples demonstrated here. Focus instead on the individual tools. There are many different applications for them and once you understand how to use these tools, not just blindly follow a series of predefined steps, then you will truly unlock the power and productivity that is available to you.
Using GIS Data from other Formats

There are three ways that you can bring GIS data into Civil 3D:

- Importing GIS Data as AutoCAD Objects
- Importing GIS Data as Civil 3D Objects
- Connecting to GIS Data

Importing GIS Data as AutoCAD Objects

AutoCAD Civil 3D can import data from a variety of sources, allowing you to edit and use the geometry using AutoCAD while maintaining the attribute data that may have been created in a different program. Without the attribute data the file will only come into the drawing as drawing objects and not contain any attribute information. On large areas it would be a monumental task to manually modify every object to contain the desired information.

The ability to utilize data from other GIS programs inside of Civil 3D provides tremendous capabilities. Being able to use this data effectively requires a few simple steps. When requesting GIS data, be sure to get the information about the accuracy of the data and how it was created. This includes the coordinate system used, the definitions of the data fields, and the accuracy of the geometry.

AutoCAD Civil 3D can import the following types:

- Autodesk SDF
- ESRI ArcInfo Coverage
- ESRI ArcInfo Export (E00)
- ESRI Shape file
- GML
- MapInfo MIF/MID
- MapInfo TAB
- Intergraph/MicroStation Design (dgn)
- OS (GB) MasterMap (GML 2)
- Spatial Data Transfer Standard (SDTS)
- Vector Product Format Coverage (VPF)
Step-by-Step

1. Start a new drawing using the ACAD.dwt template.

2. Click the Workspace button on the status bar and set the current workspace to Planning and Analysis.

3. Select Ribbon: Insert ⇒ Import ⇒ Map Import.

   The Import Location dialog box opens.

4. Browse to the dataset

5. Set the Files of type to ESRI Shapefile (*.shp).

6. Select the files Parcels.shp and Streets.shp.

7. Click <<OK>> to continue.
In the *Import* dialog box you can configure the *Layer, Coordinate Conversion, and Data* options that you wish to use to import each of these two *Shapefiles* into *Civil 3D*.

8. Click on the *Drawing Layer* field in the *Parcels* row to activate the more <<...>> button. Click this button to bring up the *Layer Mapping* dialog box.

Here you can choose to import the drawing objects onto an existing layer, create a new layer, or select a column of data from the file that you are importing to determine the layer names. This last option will allow you to do some basic thematic mapping during the import of the objects. For example, if you were importing parcel data and that data set had a column for zoning, you could have the import command create a new layer for each zoning type and place each parcel on the appropriate layer for its zoning designation. However, in this exercise you will simply import all of the parcels onto one layer.

9. Choose *Create on new layer* and name it *EX-Parcels*.

10. Click <<OK>>.

11. Repeat the process for the *Streets ShapeFile*, creating it on a new layer named *EX-Streets*. 
12. Back in the Import dialog box, click on the Data field in the Parcels row to activate the more <<…>> button.

13. Click the more <<…>> button to bring up the Attribute Data dialog box.

Here you will create Object Data from the shapefile’s attribute data. You can enter the desired name for the Object Data Table and select the desired fields to import. This is the step that allows you to bring the intelligence of the GIS file along with the geometry into AutoCAD. By creating the object data table and populating it with the information provided in the shape file you will be able to click on a parcel and find the owner name, address, zoning, and any other information that was added by the GIS department. This will also allow you to edit the geometry and data from the GIS file in AutoCAD and then export it back to any of the supported GIS formats without losing any of the attached data. If you leave the Data option set to None or Do not import attribute data, then you will only import the geometry of the file and you will lose all of the attached information. The ability to convert the attribute data to object data is one reason the Map Import feature so powerful.

14. Choose Create object data.

15. Enter Parcels for the name of the Object Data table to use.
This will create a new Object Data Table in the drawing to store the parcel attribute data. You can name this Object Data Table anything you like, but it is recommended to keep the name simple and descriptive to avoid confusion. The name must be in alphanumeric characters with a maximum length of 25 characters. The name cannot contain spaces or symbols.

16. Click <<OK>> to return to the Import dialog box.

17. Click on the Data field in the Streets row to activate the more <<...>> button. Click this button to bring up the Attribute Data dialog box.
18. Choose **Create object data**.

19. Enter **Streets** for the name of the **Object Data table to use**.

20. This time, click the **<<Select Fields>>** button. This will allow you to select only the attribute data you wish to import rather than the entire database.

21. Deselect all fields except **NAME_FULL**, **SPEED**, and **TYPE**. This option allows you to be selective about what information you import into **AutoCAD**. If you don’t want to import all of the attached data, you have control over the columns of information that you import from the shape file.

22. Click **<<OK>>** to return to the **Import** dialog box.
The completed dialog box should look like the one below. If you have assigned a coordinate system to the drawing it will display at the top of the Import dialog box. You can also assign a coordinate system to the drawing at this time by selecting the *Assign Global Coordinate System* button. If a coordinate system has been assigned to the drawing the *Input Coordinate System* column will be activated. This allows you to assign a coordinate system to the files that you are importing. If the input coordinate system is different than the current drawing coordinate system the geometry will be converted to the current drawing coordinate system as it is imported.

23. Click **<<OK>>** to begin importing the data.

24. **Zoom to Extents** to view the imported objects.
Controlling the Display of Polygons

Notice that the polygons are all displayed with a solid hatch fill. This display option is a feature of the `MPOLYGON` object. To display just the edges of the polygons you need to set the polygon display mode.

1. At the command line enter:
   Command: `POLYDISPLAY`

2. Type `E` to display only the edges of the polygons.

3. `Regen` to redisplay the Polygons.

4. Change the color of the layer `EX-Parcels` to Yellow and the later `EX-Streets` to Red.
Viewing GIS Attributes in AutoCAD

When talking about GIS data the term *attributes* refers to any type of attached data, not just block attributes as in *AutoCAD* terminology. In *AutoCAD Map 3D*, attribute data can be object data, external database data, or block attributes. *Civil 3D* is built on and includes *AutoCAD Map 3D* which enables you to view and edit this attribute data, including attributes imported from GIS files, as well as attributes created as object data in *Map 3D*. To view the attributes imported above follow these steps.

1. Pick one of the new parcels, then right-click and select ⇒ *Properties*.

2. In the *Properties* palette, scroll to the bottom and notice the attribute data from the SHP file is now attached to the parcel.

You can view and edit any of the object data here as needed.
Labeling Objects with an Annotation Template

Several types of data can be used to drive an Annotation Template. These include:

- **Object Data**
- **Linked data sources**
- **Object properties**

Any of the preceding data types and any combination of these can be used within a single Annotation Template, retrieving data from multiple sources of data into a single, or multiple lines of text to form part of the resulting label in the drawing.

Annotation Templates are blocks with attribute tags that generate the resulting text in the drawing. All annotation blocks are prefixed with `ACMAP_ANN_TEMPLATE` followed by the name of the annotation template.

**Overall Process of Using Dynamic Annotation**

There are three main steps in the overall use of Dynamic Annotation.

1. **Define Annotation Template**
   This step is a one-time setup that is saved in the drawing file. After you create an annotation template, you can always edit it. The initial setup is often an iterative process with some aspect of trial and error to get the desired behavior regarding text placement on the objects, spacing of labels, and so on.

2. **Insert Annotation**
   After creating the annotation template, you use it to perform the actual insertion of the annotation.

3. **Update or Refresh Annotation**
   Each time you insert annotation, the current values of the attributes that are used to generate the annotation are evaluated. When changes are made to the source attributes, the annotation does not automatically update. To reevaluate changes made to source data that drives the annotation, you must perform a refresh. If changes have been made to the template, which might include changes to the attribute sources, font settings and so on, an update is required.
Step-by-Step
Creating an Annotation Template

1. Continue working in the same drawing.
If you didn't finish the previous exercise you can open the drawing Annotation.dwg.

2. Freeze the layer EX-Streets.
You will only label the parcels in this exercise.

3. Select Ribbon: Annotate ⇒ Map Annotation ⇒ Define Template to launch the Define Annotation Template dialog box.

4. Click <<New>> in the Annotation Template section.

5. Name the annotation template Parcel Number, and then click <<OK>>.
The AutoCAD Block Editor opens and the Ribbon now displays the Block Editor tab.

6. At the command line enter: Command: MAPANNTXT

7. When prompted to select annotation, press Enter to create new annotation and open the Annotation Text dialog box.

8. Enter Number for the Tag.

9. Click the expression button to the right of the Value field to open the Expression Chooser.
10. Expand the **Object Data** table **Parcels**.

11. Select the field **ACCTNO**.

12. Click **<<OK>>** to return to the **Annotation Text** dialog box.

13. Enter **10** for **Height** in the **Text Options** section.

14. Click **<<OK>>**.

15. At the command line prompt **Specify left point of text**: enter **0,0** and press **Enter**.

   The block is created at the origin, 0,0. You may need to zoom in to see it.

16. Select **Ribbon: Block Editor ⇒ Close ⇒ Close Block Editor**.
17. When prompted, save the changes to ACMAP_ann_template_Parcel.

18. Click <<OK>> in the Define Annotation Template dialog box to save the template.

19. Save the drawing.

Annotating Objects

1. Select Ribbon: Annotate ⇒ Map Annotation ⇒ Insert.

2. Select the Parcel Number Annotation template.

3. Click <<Insert>>.

4. Zoom in on and pick parcels, and then Enter to add the labels.
Importing GIS Data as Civil 3D Objects

There are two types of Civil 3D objects that can be created directly from GIS data.

- Surfaces
- Pipe Networks

Step-by-Step

Creating a Surface from a Shapefile

1. Start a new drawing from the template _AutoCAD Civil 3D (Imperial) NCS.dwt

2. Click the Workspace button on the status bar and set the current workspace to Civil 3D.

3. Start a new drawing from your template that contains Civil 3D styles.

4. Select Ribbon: Home ⇒ Create Ground Data ⇒ Surfaces ⇒ Create Surface from GIS Data.
5. Enter the **Name** and select the desired **Style**.

6. Click **<<Next>>**.
7. Set the **Data source type** to **SHP**.

8. Browse to the dataset and select the file **Contours.shp**.

9. Click **<<Login>>**.
10. **Enable** the check box beside the **desired Feature class**.

11. Click **<Next>**.
You have the option to define an area of interest if you want to limit the size of the data brought in to the drawing.

12. Disable the option to **Define area of interest**.

13. Click «Next>>.
14. Set the Civil 3D Property for the GIS Field **ELEV** to the elevation data field in the source file.

15. Click <<Finish>> to create the Surface.

You will get a warning in the Event Viewer if there are crossing breaklines in the data you are importing. If so, that point will be ignored and your surface should be fine. You can zoom in and examine that location if you want to explore it further.

16. **Zoom Extents** to view the new surface.
Creating a Pipe Network from a SHP

1. Continue working in the drawing from the previous exercise.

2. Expand the **Ribbon: Insert** tab **Import** panel.

3. Click **Import GIS Data**.

4. Click the folder button ![Folder Icon](image)

   The pipes and structures will be contained in separate SHP files. By connecting to a folder rather than a specific file, then all of the SHP files in that folder will be available.

5. Browse to the folder containing the SHP files, and click **Open**.

6. Click **Connect** to connect to the folder, making all of the SHP files in that folder available.

7. Click **Next** to continue through the wizard.
8. **Name** the new Pipe Network.

9. Set the **Parts list**.

10. Set the **Surface name**.

11. Set the **Structure label style**.

12. Set the **Pipe label style**.

13. Click **<<Next>>**.
On the *Schema and Coordinates* panel of the wizard you will see all the SHP files in the connected folder along with the coordinate systems they were created in.

14. Click **<<Next>>** to continue through the wizard.
15. Set the **Imported pipe feature class** to **Default:Pipes** (the SHP file containing the Pipe data).

16. Confirm the **Civil 3D pipe shape** is set to **Circular**.

17. Click **<<Add>>**.
18. Set the **Start Structure** to **StructStart**.

You may need to scroll through the list of *Civil 3D pipe properties* to the **Geometry** section.

19. Set the **End Structure** to **StructEnd**.

20. Set the **Start Invert Elevation** to **StartInvert**.

21. Set the **End Invert Elevation** to **EndInvert**.

22. Set the **Inner Diameter** to **InsideDia**.

You may need to scroll down the list of *Civil 3D pipe properties* to the **Part Data** section.

23. Click **<<Next>>**.
24. Confirm the **Imported structure feature class** is set to **Default:Structures** (the SHP file containing the Structure data).

25. Confirm the **Civil 3D structure shape** is set to **Cylindrical**.

26. Click **<<Add>>**.
27. Set the **Rim Elevation** to **RimElev**.

28. Set the **Sump Elevation** to **SumpElev**.

29. Click **<<Next>>**.

You will now see the *No Shape Attributes Assigned* dialog box. This is because the SHP file that we are importing did not have any shape attributes for us to assign that could be matched with properties of the parts from the part list.

30. Click **Use the default shape with default shape attributes.**

31. Back on the *Data Mapping: Structures* panel of the wizard click **<<Next>>** again.
32. Confirm that **Import all GIS data** is selected.

If you are importing SHP files that encompass a large area you can be selective about how much of the data is imported here.

33. Click **<<Next>>**.
34. Enable the option to **Snap pipe and structure tolerance**.

35. Confirm the **tolerance** is set to **0.0015** feet.

36. Click **<<Finish>>**.

The pipes and structures are now imported and labeled, creating a new **Pipe Network**.

The **Event Viewer** opens to announce that the **Pipe Network** has been created.

37. Close the **Event Viewer**.

38. Zoom in and examine the new **Pipe Network**.

You may notice the **Invert In** and **Invert Out** elevations are backwards on each of the structures with the **Invert In** lower than the **Invert Out**. Next, you will reverse the pipe network to correct this issue.

39. Select **Ribbon: Modify ⇒ Design ⇒ Pipe Network**.

The **Pipe Networks** tab is displayed.
40. Expand the Ribbon: Pipe Networks tab Modify panel.

41. Click Change Flow Direction.

42. Select Structure (5) as the Upstream starting point.

43. Then select Structure (1) as the Downstream ending point.

44. The entire network should now be highlighted. Enter to end the command and reverse the flow direction of the network.

45. Regen to update the labels.

46. Zoom in and examine the new pipe network.
Connecting to GIS Data

AutoCAD Civil 3D includes the option to use FDO (Feature Data Objects), a technology that allows you to connect directly to GIS data, rather than import it, as we did in the example earlier. The process of connecting to GIS data is very different from importing it, and the resulting information that is created in your drawing is also different. For example, when you import GIS linear data, basic AutoCAD objects, like polylines, are created. When you connect to data, Features are created.

When you import data, you are copying the objects into AutoCAD with no link to the original data. However, when you connect to data, there is a link to the original data, similar to an XREF. This means that any changes made elsewhere to the original data can be updated in your drawing. You also have the option to directly edit the original data if you are connected to it, provided you have permission to do so.

Once you have learned how to use both methods, importing and connecting to GIS data, you can then decide when each method is best suited for your projects and tasks.

Step-by-Step

1. Start a new drawing from the template ACAD.dwt.

2. Click the Workspace button on the status bar and set the current workspace to Planning and Analysis.

3. In the Display Manager, click the Data button, and then select Connect to Data...
4. From the Data Connections by Provider list, select **Add SHP Connection**.

5. Change the **Connection name:** to **Parcels**.

6. Click the SHP button.

7. Browse to the dataset and select **Parcels.shp**.

8. Click **<<Connect>>**.

9. Once the connection is made click **<<Add to Map>>**.
Notice a new layer appears in the Display Manager and the Features appear in the drawing editor. Notice that all features are the same color. Next we will explore some basic display options with connected data.

10. In the Task Pane set to Display Manager, right-click the desired layer and select Edit Style.

The Style Editor opens, where you can modify a geospatial data layer’s style properties. Rules can also be set up to display the layer based on certain data conditions, zoom/scale values, etc..

11. In the Style Editor palette, click <<New Theme>>.

This opens the Theme Polygons dialog box, where you create a theme, such as applying a different color value to each range of land values, resulting in a thematic map.
12. Set the **Property** to **ZONING**.

13. For **Legend Text**, enter **Zoning**.

14. Click **<<OK>>**.

15. Close the Style Editor.

The parcels in the drawing are themed.
